
D is the actual_hot − Planck_reference difference on refined solutions. R_h and R_p are each branch's nominal − refined change.
All bars show maximum absolute differences on 109 saved nodes. These are empirical finite-resolution comparisons, not rigorous or global error bounds.
Stress panel uses columns 1–5 of the signed six-vector; its shear coordinate is excluded. Exact zeros are labeled 0, not assigned a log-scale floor.
