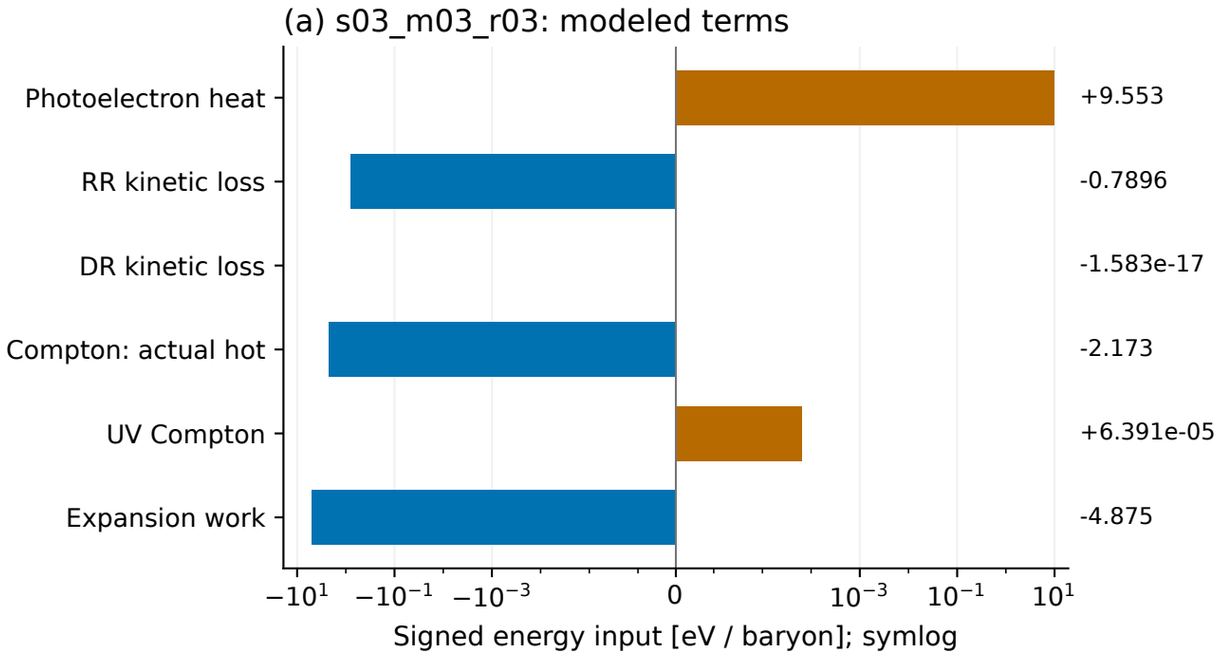
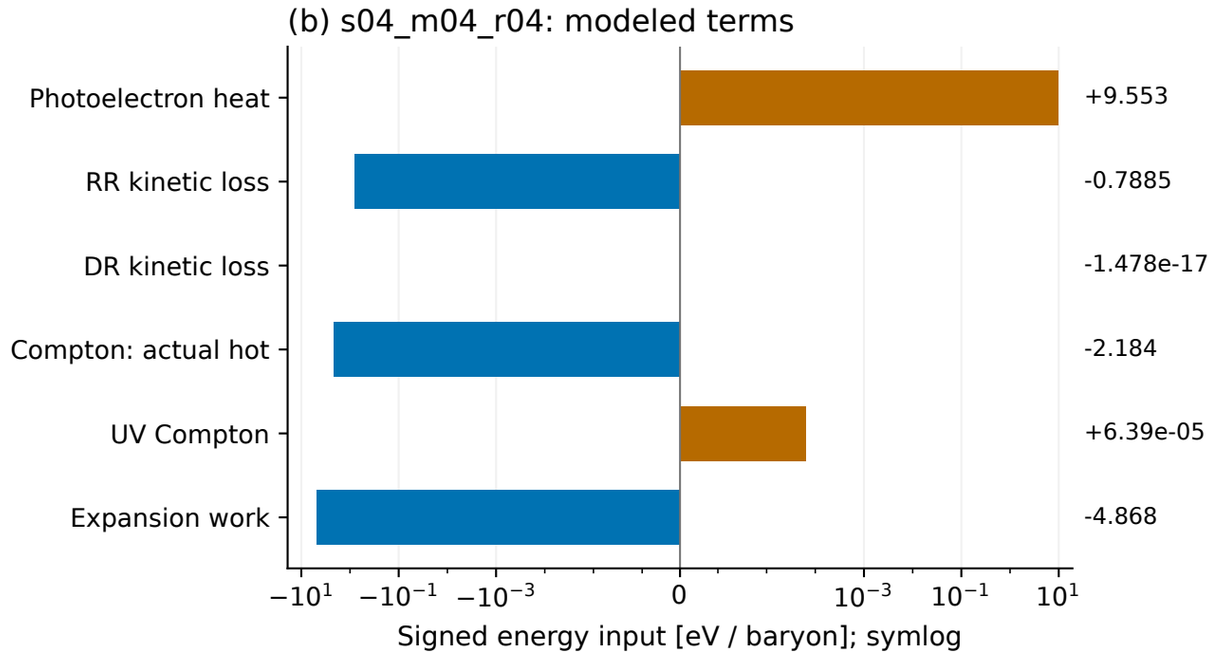
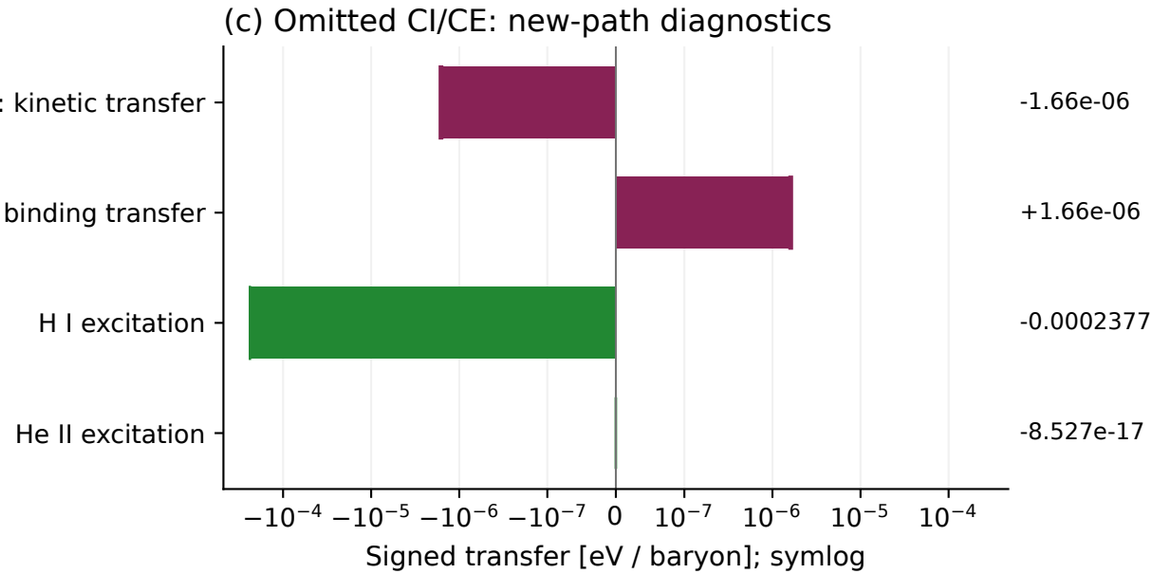
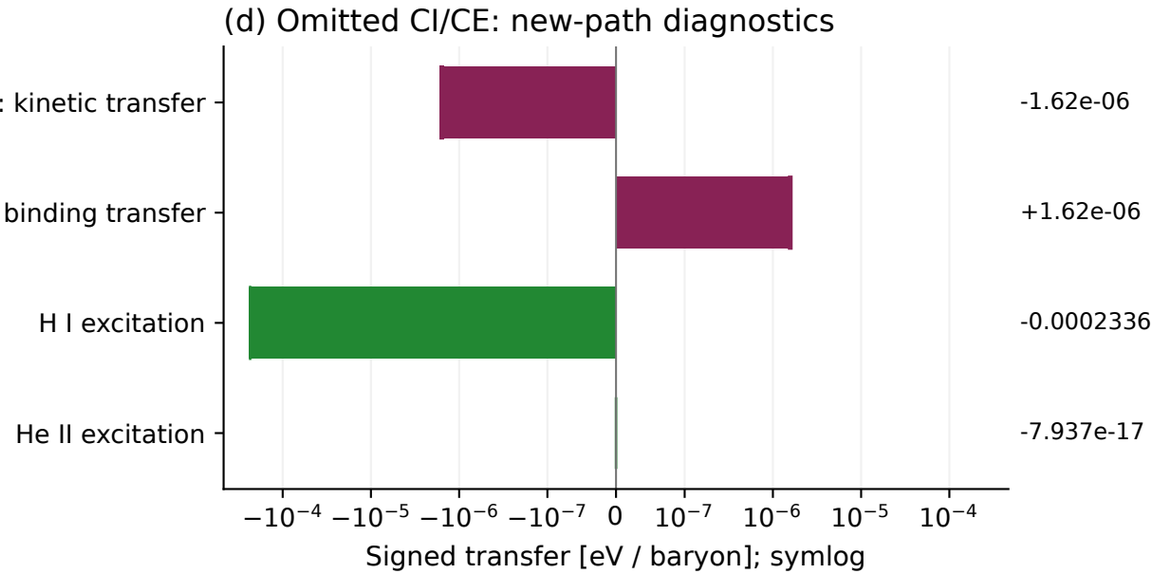
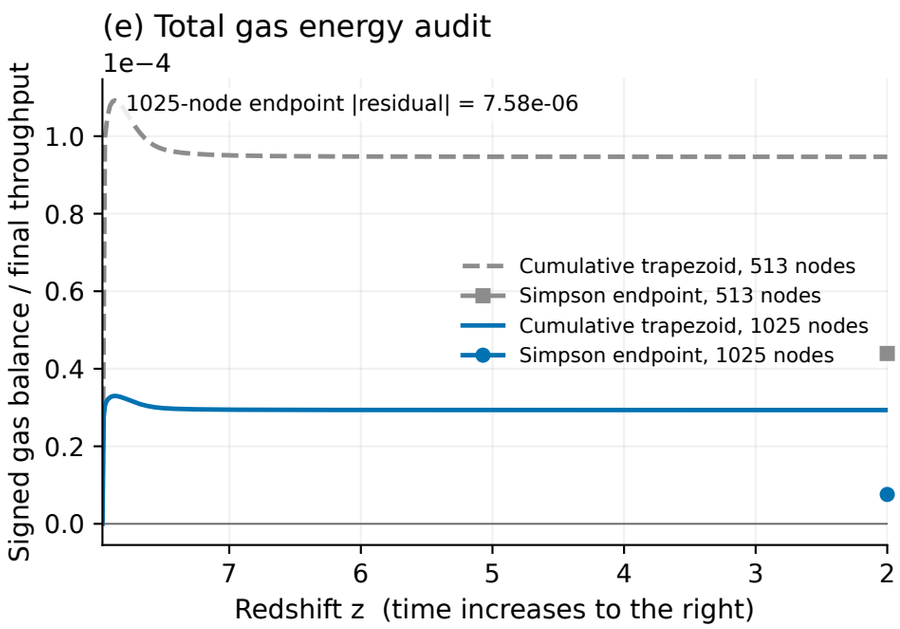
Energy transfers on the newly evolved actual_hot paths

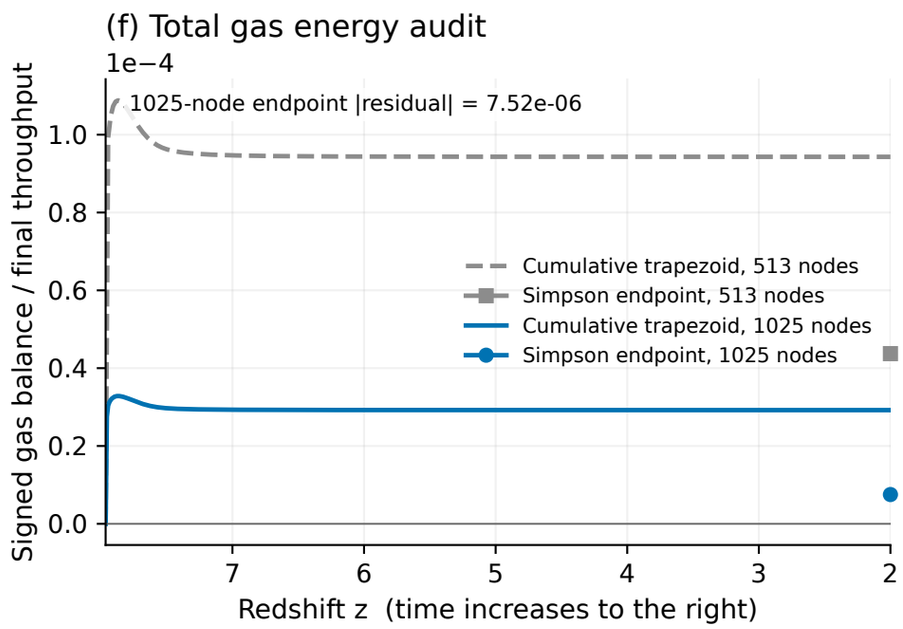












Refined paths; positive = gain. Modeled energy bars use dense1025 Simpson. Gas audit includes binding energy and expansion work.
CI/CE bars are omitted-process diagnostics, not exchanges applied by the ODE. CI kinetic and binding transfers cancel in total gas.
Solid CI/CE bars: both interval endpoints in fit range. Hatched: continuation / boundary, without a published accuracy claim. Li CI/CE and He I CE remain unavailable.
