THERM02 · signed gas ledger and separately owned radiation baths
Bath debits are passive; photon / Einstein backreaction remains omitted

Actual grey photons: hot term + external UV

External Planck bath + external UV

Signed gas-energy contribution [eV / baryon]

$\Delta\varepsilon_{gas}$
$+I_{abs}$
$-I_{escape}$
$-I_{work}$
$+I_C$
$+I_{UV,C}$

Signed symlog; linear below 6.5e-05

Redshift z (time increases to the right)

Absolute throughput integrated before normalization

Measured exchange scale; no backreaction error bound

Normalized absolute residual / quadrature change

actual hot ledger residual
actual hot GL8–GL16
external Planck ledger residual
external Planck GL8–GL16
Frozen 3 × 10^{-6} gate

$|Q_C|/(HU)$ with the labelled energy owner

Hot / actual HU_γ
Planck / external HU_{ref}
Planck / actual HU_γ (scale only)
