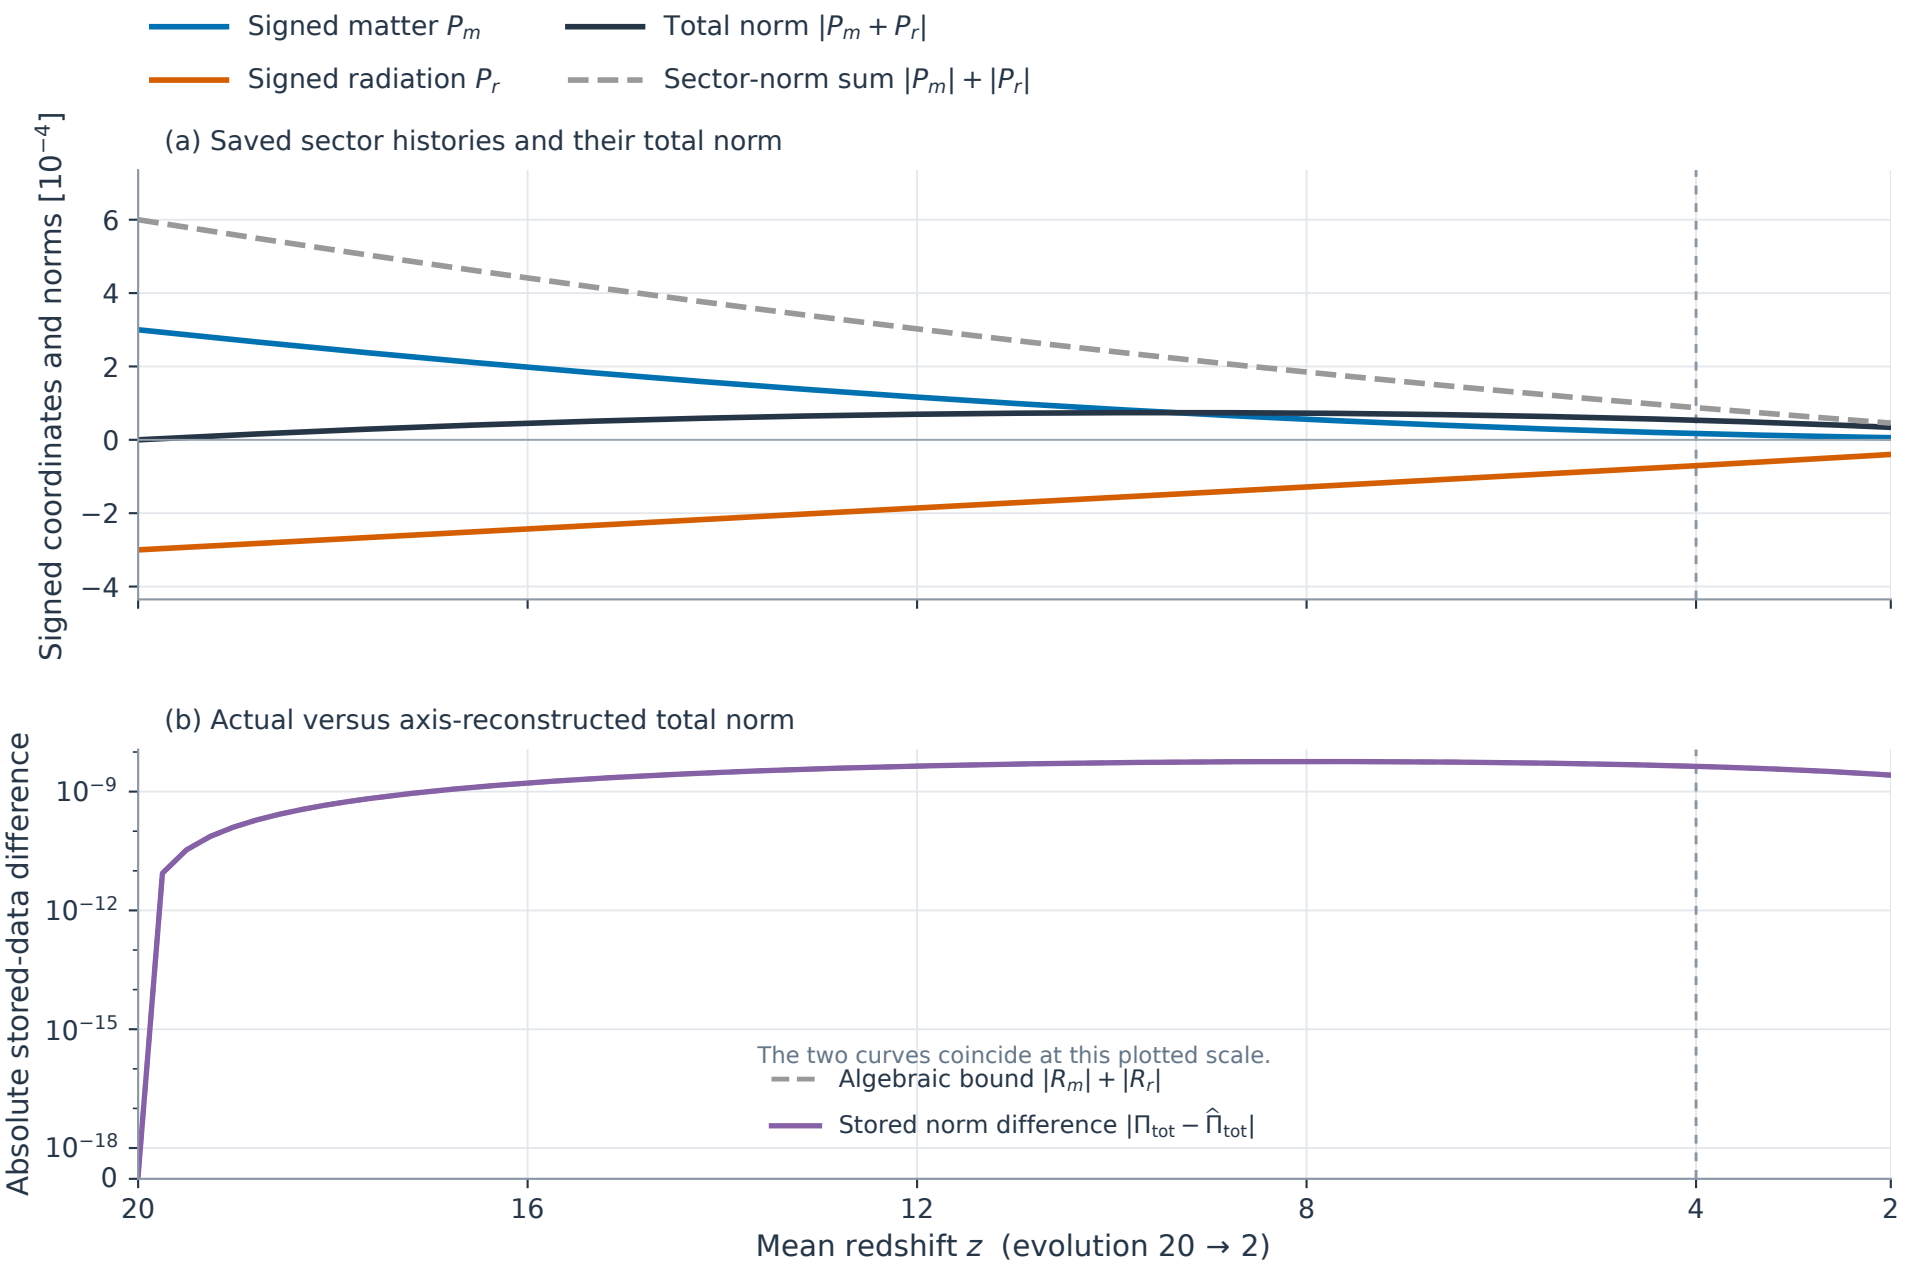
Cancellation requires the signed sector sum

Initial $(S_i, P_{m,i}, P_{r,i}) = (0, +3, -3) \times 10^{-4}$ | collisionless, fixed $L = 8$ | Frobenius



All stress coordinates use full Frobenius normalization. The sector-norm sum is a bound, not the total norm.
Lower panel: logarithmic above 10^{-18}, linear to zero; no display floor. Dashed vertical line: z=4 continuation join.
Common redshift, case-dependent proper time. Preliminary saved-data comparison; neither an ODE error nor a physical validation.
