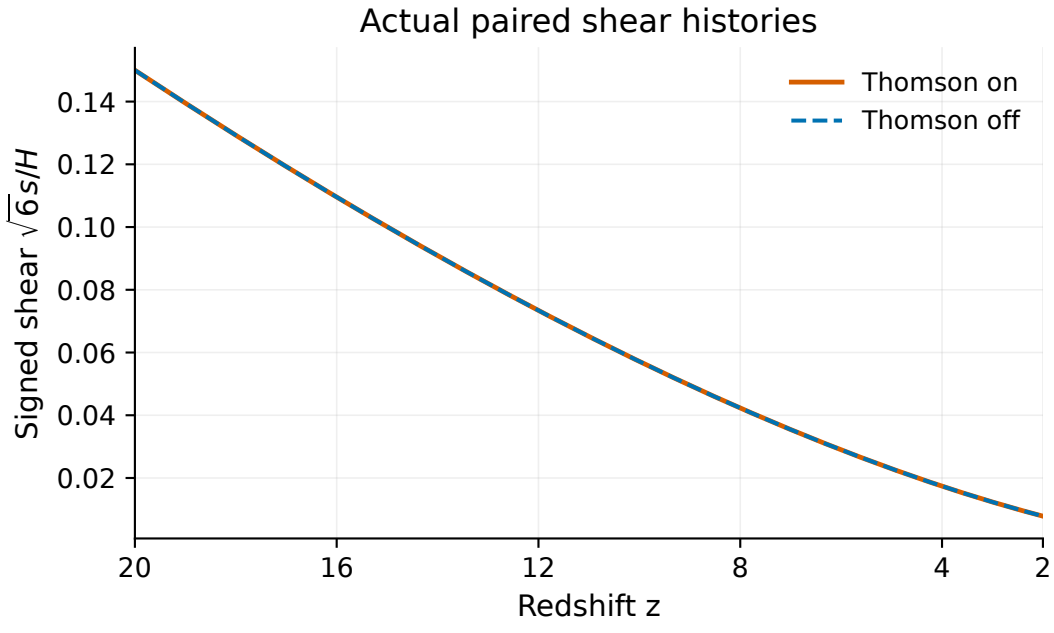
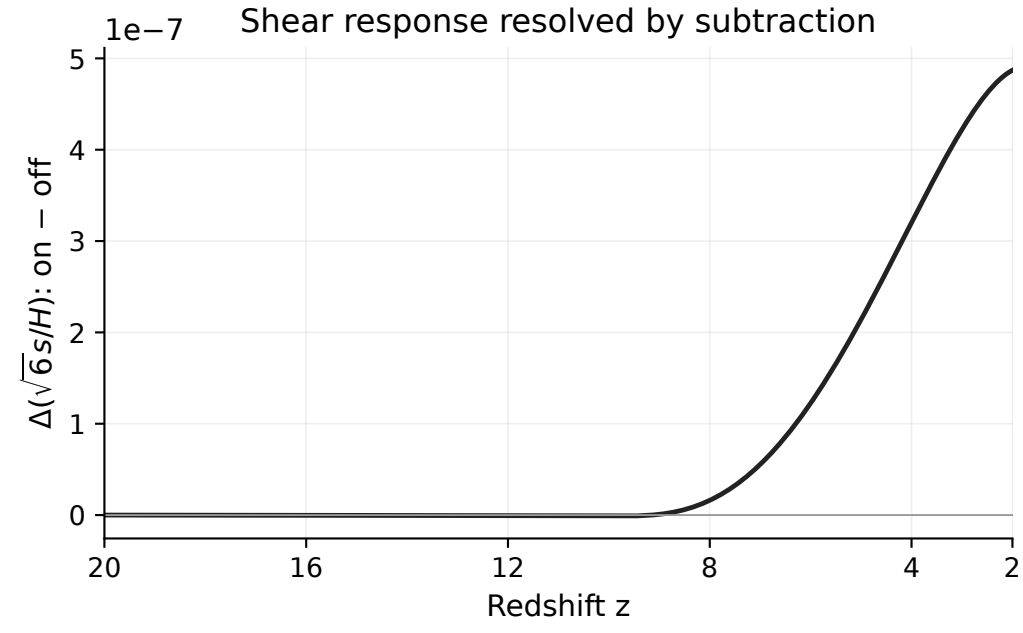
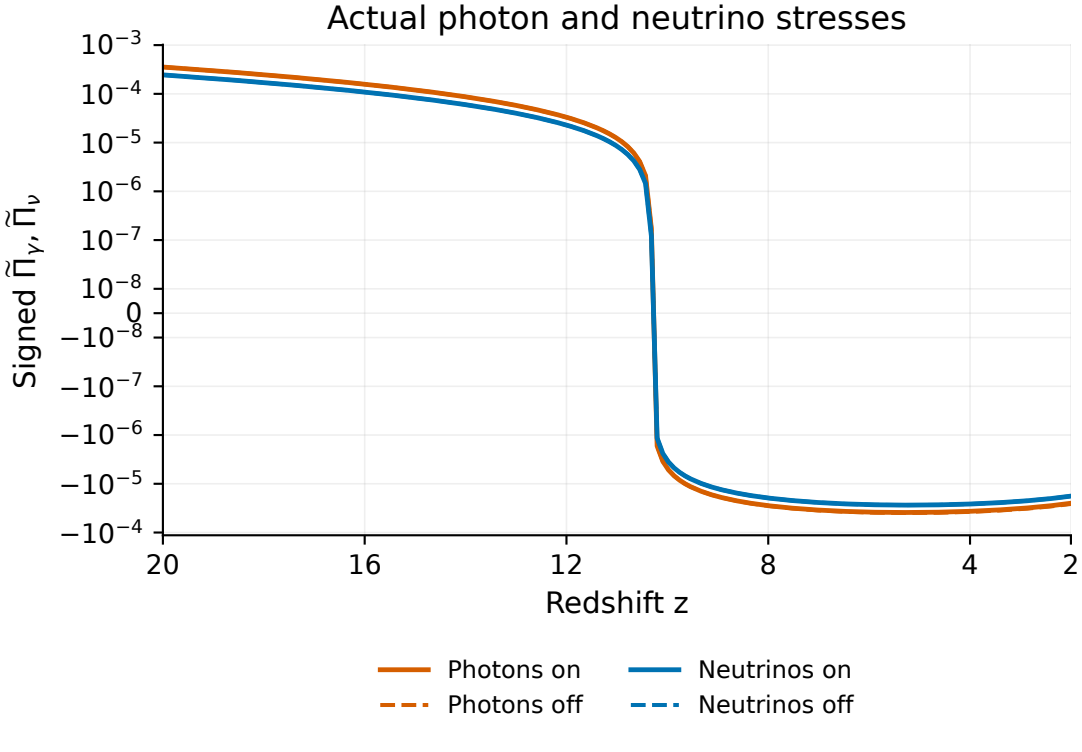
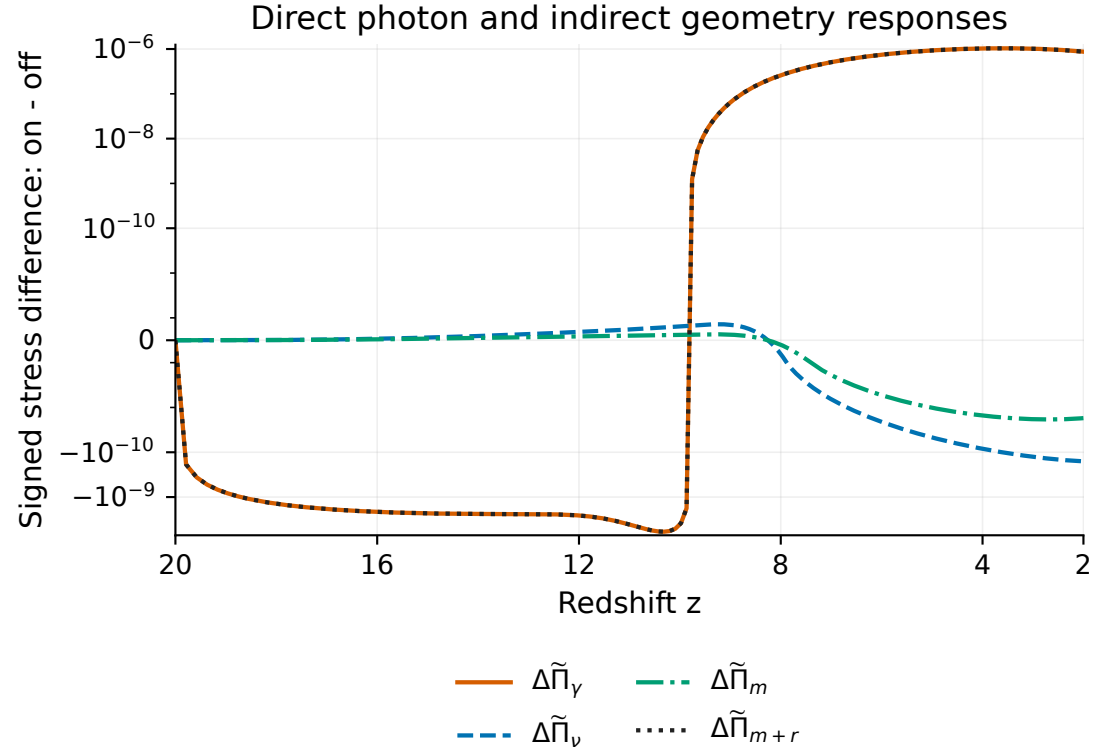
Distinct opacity-off control: paired finite-model response

2/2 completed cases | Main-case trajectory reused; one distinct completed control









Off-case tau_T = 0.069333554964 is a potential electron column; its applied photon collision term is zero.

Matter and neutrinos have no direct Thomson term; their paired response passes through the shared geometry.

All differences are on minus off at the frozen solver tolerances; global convergence remains NOT_RUN.
