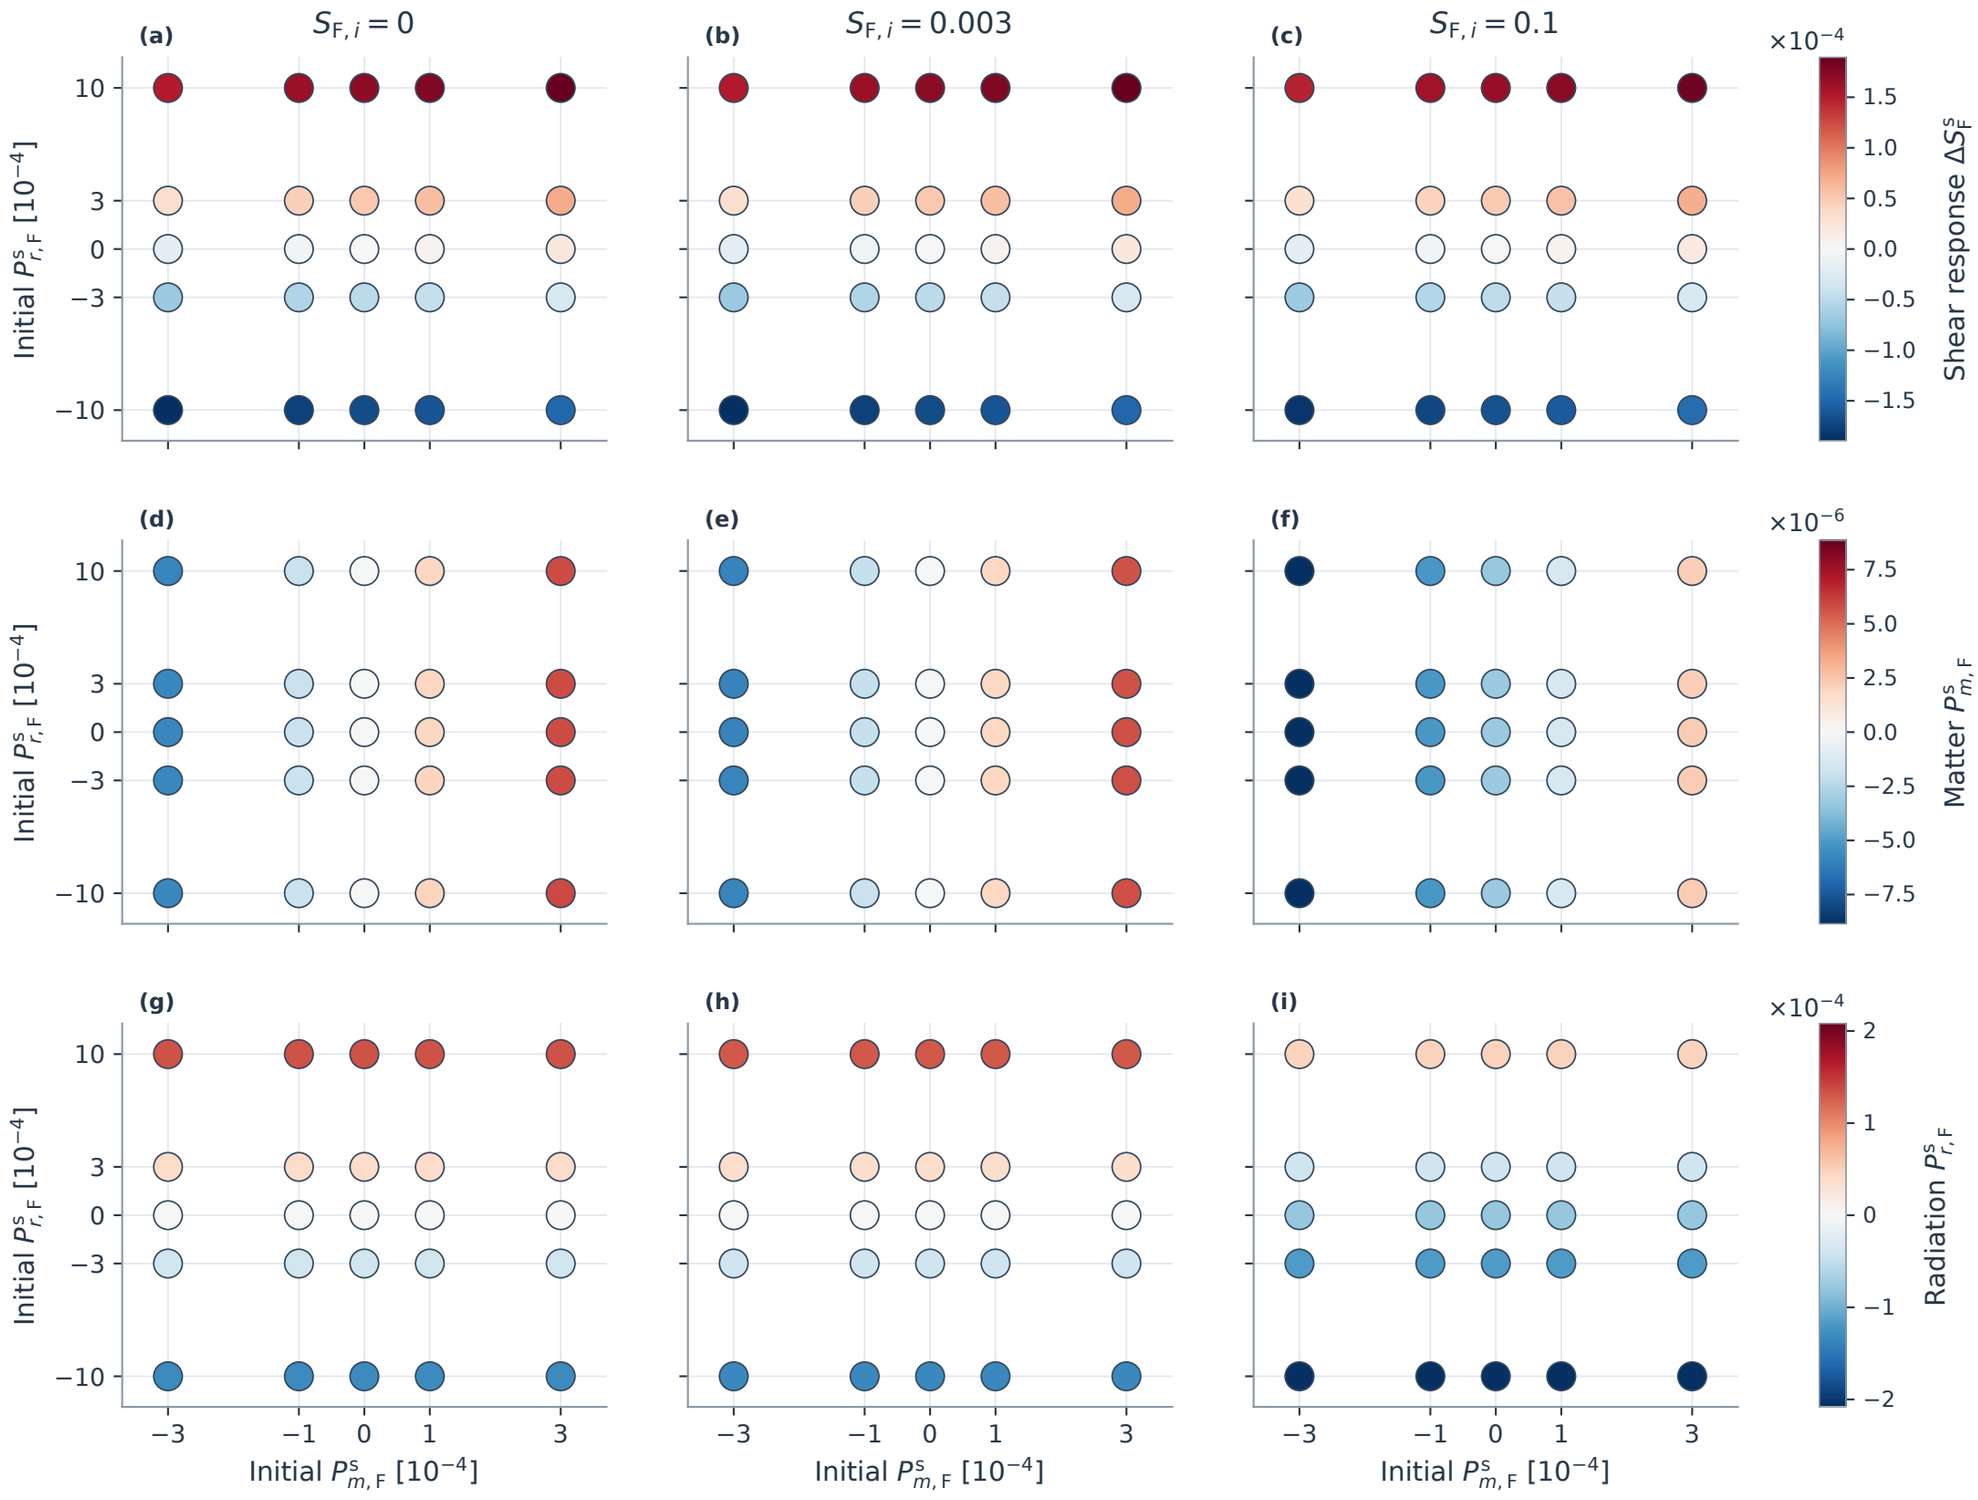
Finite-grid endpoint responses at $z = 2$

25 actual points per slice; true nonuniform stress coordinates | signed full-Frobenius quantities



$\Delta S^{\mathrm{s}}_{\mathrm{F}} = S^{\mathrm{s}}_{\mathrm{F}}(S_i, P_{m,i}, P_{r,i}; z = 2) - S^{\mathrm{s}}_{\mathrm{F}}(S_i, 0, 0; z = 2)$. Each row shares one symmetric color scale.

No interpolation or unsampled surface. Collisionless fixed L=8, common redshift with case-dependent proper time; preliminary.
